Java API for XML Web Services

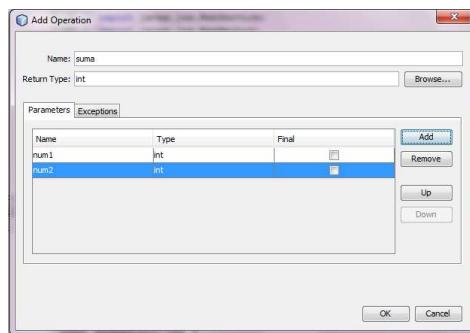

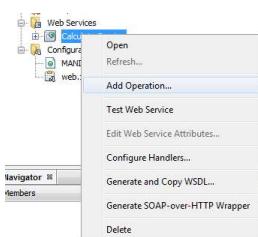

- ▶ JAX-WS (Java API for XML Web Services) es una interfaz de programación de aplicaciones (API) de Java basada en XML para la creación de servicios web.
- ▶ Es parte de la plataforma Java EE.
- ▶ JAX-WS utiliza anotaciones para simplificar el desarrollo y despliegue de los clientes y puntos finales de servicios web.

Creación de un servicio web sobre una aplicación web en NetBeans

Agregar una operación

Deploy exitoso de la aplicación Web

Deploy del Web Service

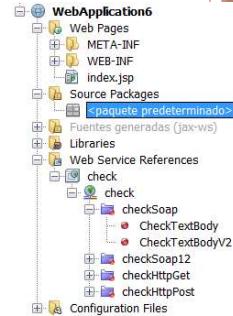

Desarrollo de clientes de servicios web

Pasos

1. Crear una aplicación Web
2. Crear un nuevo Cliente de Servicio Web
3. Especificar el URL del WSDL siguiente

<http://wsf.cdyne.com/SpellChecker/check.asmx?wsdl>

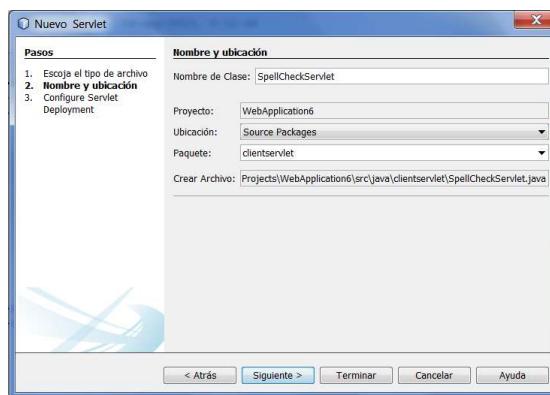

Desarrollo del cliente

- ▶ El cliente consiste de un JSP que le permite al usuario introducir el texto y después se llama a un servlet que invoca el servicio y genera la respuesta.
- ▶ En la carpeta de Web Pages de la aplicación modifica el index.jsp

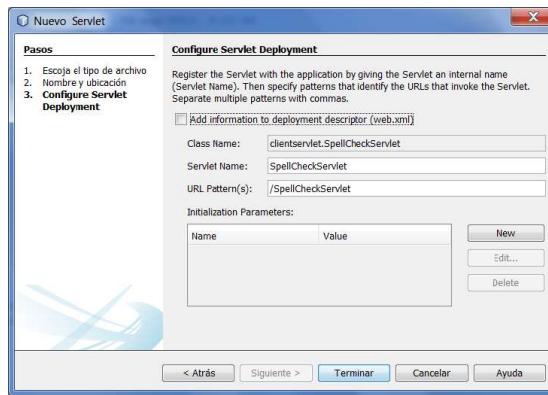

Codificación del JSP

```
<%@page contentType="text/html" pageEncoding="UTF-8"%>
<!DOCTYPE html>
<html>
    <head>
        <meta http-equiv="Content-Type" content="text/html; charset=UTF-8">
        <title>JSP Page</title>
    </head>
    <body>
        <form name="Test" method="post" action="SpellCheckServlet">
            <p>Enter the text you want to check:</p>
            <p><textarea rows="7" name="TextArea1" cols="40" ID="Textareal"></textarea></p>
            <p>
                <input type="submit" value="Spell Check" name="spellcheckbutton">
            </p>
        </form>
    </body>
</html>
```

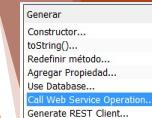

Creación y codificación del servlet

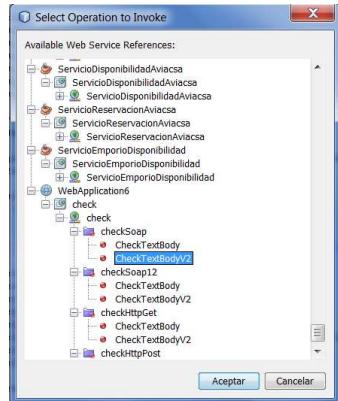

Configuración del servlet

```
@WebServlet(name = "SpellCheckServlet", urlPatterns = {"/SpellCheckServlet"})
public class SpellCheckServlet extends HttpServlet {
    protected void processRequest(HttpServletRequest request, HttpServletResponse response)
        throws ServletException, IOException {
        response.setContentType("text/html;charset=UTF-8");
        PrintWriter out = response.getWriter();
        try {
            /*
             * TODO output your page here. You may use following sample code.
             */
            out.println("<html>");
            out.println("<head>");
            out.println("<title>Servlet SpellCheckServlet</title>");
            out.println("</head>");
            out.println("<body>");
            out.println("<h1>Servlet SpellCheckServlet at " + request.getContextPath() +
                    "</h1>");
            out.println("</body>");
            out.println("</html>");
        } finally {
            out.close();
        }
    }
}
```

Seleccionar la operación CheckTextBodyV2

Insertar el siguiente código en el ProcessRequest Method

```
//Get the TextArea from the JSP page
String TextArea1 = request.getParameter("TextArea1");

//Initialize WS operation arguments
java.lang.String bodyText = TextArea1;

//Process result
com.cdyne.ws.DocumentSummary doc = checkTextBodyV2(bodyText);
String allcontent = doc.getBody();

//From the retrieved document summary,
//identify the number of wrongly spelled words:
int no_of_mistakes = doc.getMisspelledWordCount();

//From the retrieved document summary,
//identify the array of wrongly spelled words:
List allwrongwords = doc.getMisspelledWord();
```

```

out.println("<html>");
out.println("<head>");
out.println("<title>Spell Checker Report</title>");
out.println("</head>");
out.println("<body>");
out.println("<h2><font color='red'>Spell Checker Report</font></h2>");
out.println("<hr><b>Your text:</b> " + allcontent + "<br>");

/*For every array of wrong words (one array per wrong word), identify the wrong word,
the number of suggestions, and the array of suggestions. Then display the wrong word and
the number of suggestions and then, for the array of suggestions belonging to the current
wrong word, display each suggestion: */

for (int i = 0; i < allwrongwords.size(); i++) {
    String oneincorrectword = ((Words) allwrongwords.get(i)).getWord();
    int oneincorrectsuggestioncount = ((Words) allwrongwords.get(i)).getSuggestionCount();
    List allsuggestions = ((Words) allwrongwords.get(i)).getSuggestions();
    out.println("<hr><p><b>Wrong word:</b> " + oneincorrectword +
    "</font>" );
    out.println("<p><b>" + oneincorrectsuggestioncount + " suggestions:</b><br>" );
    for (int k = 0; k < allsuggestions.size(); k++) {
        String onesuggestion = (String) allsuggestions.get(k);
        out.println(onesuggestion);
    }
}

```

```

//Display a line after each array of wrong words:
out.println("<hr>");

//Summarize by providing the number of errors and display them:
out.println("<font color='red'><b>Summary:</b> " + no_of_mistakes + " "
mistakes "</font>");

for (int i = 0; i < allwrongwords.size(); i++) {
    String oneincorrectword = ((Words) allwrongwords.get(i)).getWord();
    out.println(oneincorrectword);
}

out.println(".");
out.println("</font>");
out.println("</body>");
out.println("</html>");

```

Corregir los imports

Ejecutar el proyecto

Enter the text you want to check:

the wurld is a beotiful place

Spell Check

Spell Checker Report

Your text: "the wurld is a beotiful place"

Wrong word: **wurld**

25 suggestions:

world wield wold wold wild weld worlds warlord willed worldly welds wolds wilds veld would

Wrong word: **beotiful**

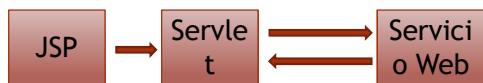

21 suggestions:

beautiful beautifully botly beautifuler bedevil beautifulest bedeviled beautifulness butterfly bedevil butterfly's butterflying bedfellow's

Summary: 2 mistakes (wurld beotiful).

Ejercicio de repaso

- ▶ Crear un cliente de servicio Web usando la siguiente referencia
- ▶ <http://www.webservicex.net/CurrencyConvertor.asmx?wsdl>
- ▶ Crear un JSP para la lectura de parámetros y un servlet para la invocación del servicio, y la generación del response.

Tarea

- ▶ Crear tres clientes (con JSPs o servlets) que invoquen a tres servicios Web públicos.
